

A quote calculator that lives inside WordPress

Instant Quote Form, a plugin for Ruiz Window Co., an invented window and gutter cleaning company: customers price the job themselves and every request lands in the admin.

The problem

A cleaning company answers the same pricing question all day by phone and email. A plain contact form gives no price, and a generic form plugin cannot do the math or keep requests organized.

What I built

- A one-card calculator: house type as line drawings, a window stepper, and a live price whose digits roll on change
- A Gutenberg block with editor settings, and an `[instant_quote]` shortcode for any page
- Requests stored as a private post type with an inbox, status filter and a Booked status
- Settings on the Settings API for rates, minimums, discounts, add-ons and emails
- Nonces, a honeypot, a rate limit, a server-side estimate and a clean uninstall

Measured results

25 of 25

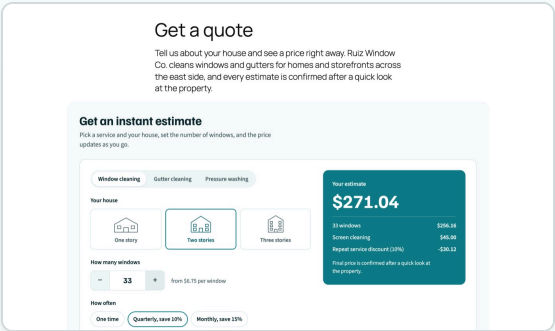

PHPUnit tests pass inside a real WordPress 7.1 (wp-env), 77 assertions

\$264.06

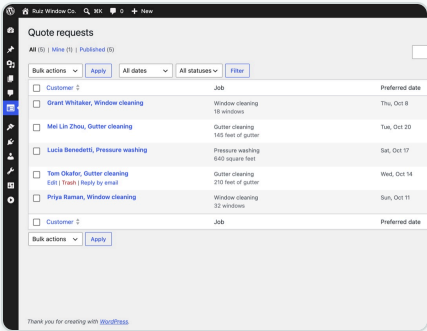

a real request priced live, stored with the same estimate, then booked

5 requests

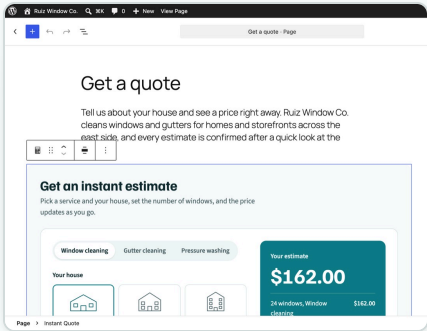

sent through the real form, each saved with an estimate recalculated on the server

The calculator on the site

The request inbox

The block in the editor

Ruiz Window Co. and every customer in the inbox are invented, with example.com emails and 555 numbers. The site is a local WordPress on the default Twenty Twenty-Five theme.

Stack

- PHP
- WordPress block API
- Settings API
- Custom post type
- PHPUnit
- wp-env
