

An assistant that cites the page, or says it does not know

A support assistant for Blue Harbor Plumbing, a company invented for this demo, that answers only from five handbook documents.

The problem

Customers ask the same questions about prices, bookings and warranties. A generic chatbot answers quickly but can invent a price or a policy, and nobody can check where an answer came from.

What I built

- Answers only from the company's documents, with a footnote on every claim that names a handbook page
- Clicking a footnote scrolls the handbook pane and outlines the exact paragraph
- Refuses when the documents do not cover the question, before any model is called
- Checks citations after generation and strips any that point at nothing
- Documents page to add files, and three answer backends including a no key mode

Measured results

~2 ms

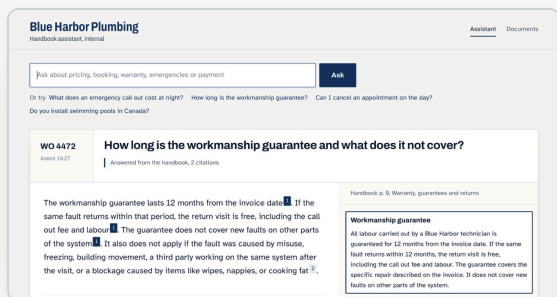

out of scope questions are refused by the retrieval guard with no model call

17 pages

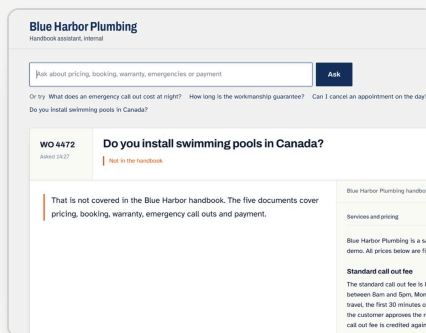

five documents paginated so a citation can name a page

0 vector DBs

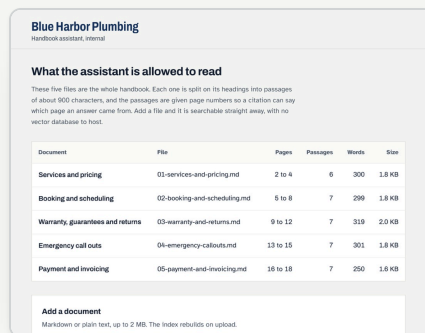

heading aware chunking plus BM25 in plain Python, nothing extra to host

A cited answer beside the handbook page it came from

An honest refusal

Documents page

Answers in these screenshots were generated by claude-haiku-4-5 through the local Claude CLI. The same code runs against the Anthropic API, or with no model at all, in which case it returns the best matching passage.
