

A landing page that scores 100 on a phone

A hand-designed one-page site for Conebook, an invented logbook app for pottery studios, live on GitHub Pages.

The problem

Template landing pages look like every other template and load slowly on phones, which is where most visitors arrive. A slow, generic page loses the sign-up before it is read.

What I built

- Its own brand: Fraunces set upright, Instrument Sans, cool stone with one iron-oxide glaze accent
- A firing curve drawn as live SVG that draws once in 900 ms, plus a CCO kiln photo
- Two waitlist forms with inline validation, a honeypot and a no JavaScript fallback
- Monthly and yearly pricing toggle, FAQ and a phone layout that keeps the headline first
- Astro static build deployed by GitHub Actions on every push

Measured results

100 × 4

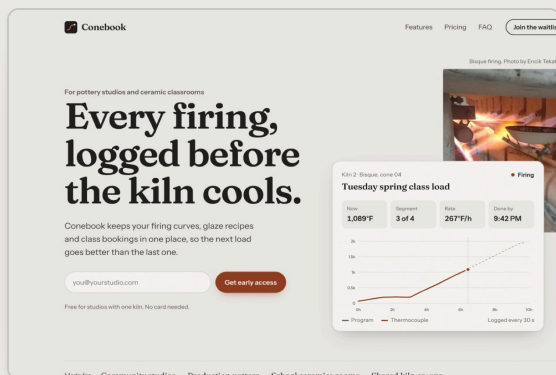

all four mobile Lighthouse categories on the live URL, in 4 of 5 runs on Oct 5 (the fifth scored 99)

129 KiB

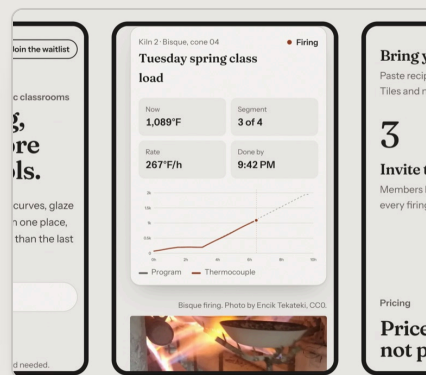

total page weight on the live URL, headline as the largest paint

98 vs 89

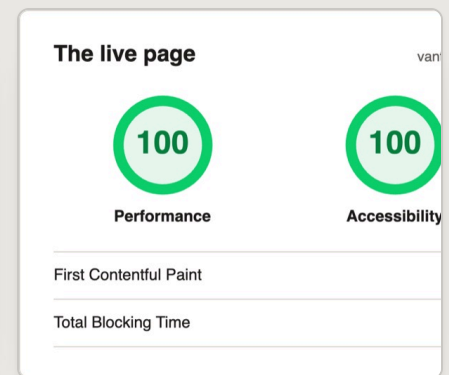

Performance for the same page as built and with a typical template stack added

Phone screens

Mobile Lighthouse, live

The GitHub Pages copy validates the form but does not store entries. The same build posts to Netlify Forms or any form backend. Kiln photo by Encik Tekateki on Wikimedia Commons, CC0.
