

An AI agent that asks before it acts

An agent that works the inbound lead inbox for Fernwood Studio, a design agency invented for this demo.

THE PROBLEM

Leads arrive through a form and sit for days. Automating replies is risky: an agent can answer spam, misjudge a big lead, or send something nobody approved, and afterwards no one can explain why.

WHAT I BUILT

- Eight tools per lead: fetch, enrich, score, guardrails, draft, approval, CRM row, team summary
- Leads scoring 65 or more, or flagged by a guardrail, wait for a person to approve
- Guardrails block spam before the model is called
- Deterministic score where every point carries a written reason
- A run log of every tool call with what it returned

MEASURED RESULTS

40 calls

tool calls in a full run over 7 seeded leads, every one logged

15 tests

pass with no API key, including reasons always summing to the score

1 bug

found by the tests: a budget like "about 40k" was being discarded

Run log of every tool call

The approval gate

Scored CRM
