

An assistant that **cites its sources**, or says it does not know

A support assistant for Blue Harbor Plumbing, a company invented for this demo, that answers only from five handbook documents.

THE PROBLEM

Customers ask the same questions about prices, bookings and warranties. A generic chatbot answers quickly but can invent a price or a policy, and nobody can check where an answer came from.

WHAT I BUILT

- Answers only from the company's documents, with a numbered citation on every claim
- Shows the passage behind each citation with its match score
- Refuses when the documents do not cover the question, before any model is called
- Checks citations after generation and strips any that point at nothing
- Admin page to add documents, and three answer backends including a no key mode

MEASURED RESULTS

~2 ms

out of scope questions are refused by the retrieval guard with no model call

5 docs

pricing, booking, warranty, emergency call outs and payment

0 vector DBs

heading aware chunking plus BM25 in plain Python, nothing extra to host

A cited answer drawn from two documents

An honest refusal
