

A landing page that scores 100 on a phone

A hand-designed one-page site for Conebook, an invented logbook app for pottery studios, live on GitHub Pages.

THE PROBLEM

Template landing pages look like every other template and load slowly on phones, which is where most visitors arrive. A slow, generic page loses the signup before it is read.

WHAT I BUILT

- Its own brand: Fraunces and Instrument Sans, a warm paper palette, an asymmetric hero
- A firing curve drawn as live SVG instead of an image
- Two waitlist forms with inline validation, a honeypot and a no JavaScript fallback
- Monthly and yearly pricing toggle, FAQ and a mobile layout
- Astro static build deployed by GitHub Actions on every push

MEASURED RESULTS

100 × 4

all four mobile Lighthouse categories on the live URL, three runs in a row

0.8 s

first and largest contentful paint, 0 ms blocking time, 0.007 layout shift

< 2 KB

of inline JavaScript and no script files

Desktop hero

Phone screens

Mobile Lighthouse scores

The GitHub Pages copy validates the form but does not store entries. The same build posts to Netlify Forms or any form backend.
