

Stripe checkout with a webhook you can trust

A Node and Express store for Fieldnote, a made up notes product, wired to Stripe in test mode end to end.

THE PROBLEM

A small product business wants one-time and recurring sales, self-serve billing, and order records that always match what Stripe charged.

WHAT I BUILT

- Checkout for a \$29 guide and a Pro plan at \$9 a month or \$90 a year
- Customer portal so subscribers update cards or cancel themselves
- Signed webhook that marks orders paid, active, renewed or canceled
- Orders page with revenue, subscribers and an empty state

MEASURED RESULTS

10/10

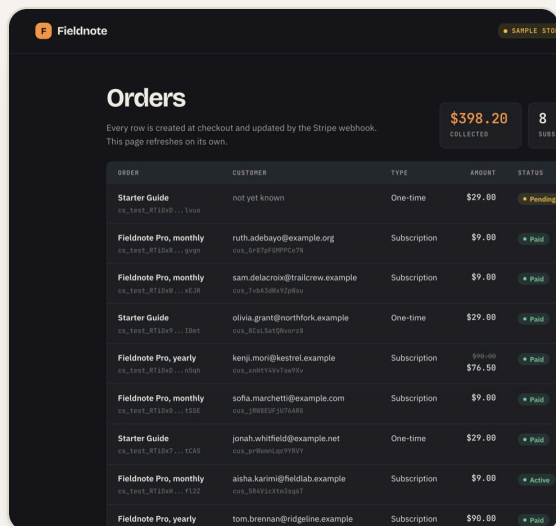

end to end checks pass against stripe-mock, Stripe's official API mock

3 plans

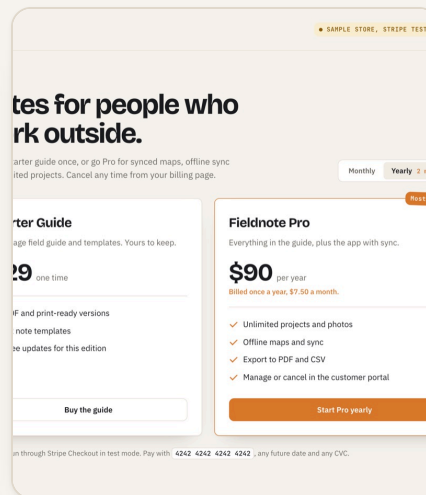

one-time, monthly and yearly, all tested through checkout and webhook

0 double counts

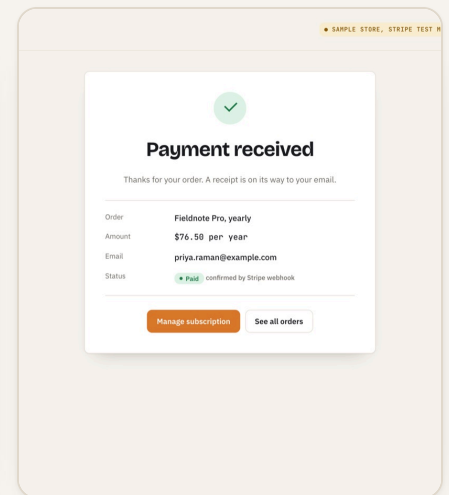

a bad signature is rejected and a retried event is ignored, both tested

Orders kept in sync by the webhook

Pricing with the monthly and yearly switch

Success page confirmed by the webhook

Screenshots come from the app running against stripe-mock with validly signed webhook events. The hosted Stripe Checkout page itself is not shown.

STACK

Node 22 Express stripe npm

HTML, CSS, JS stripe-mock
