

An AI-built app, audited and made production ready

Mossy Paws, a booking app for a made up dog groomer, written the way AI builders tend to produce apps, then fixed in four commits.

The problem

The app looked fine in a quick click-through. Underneath, staff login landed on a 404, a secret key shipped to every browser, the bookings API returned customer data with no sign in, the build failed and the page broke on phones.

What I built

- Server-side sign in with a signed httpOnly cookie and middleware on the admin area
- Keys moved to server-only code, .env out of git, a bundle scan for secrets
- Filtering and pagination on the server instead of downloading everything
- Loading, error and empty states, a responsive layout, and a three-step booking flow with real dog photos
- 19 unit tests and an 11 check production smoke test

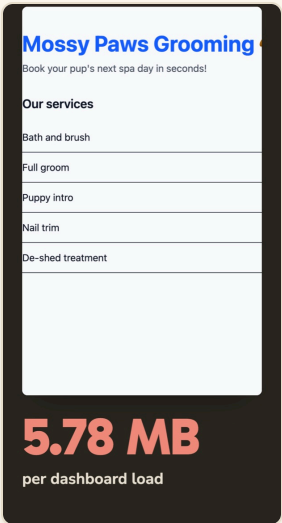

Measured results

5.78 MB → 88 KB
dashboard data per load

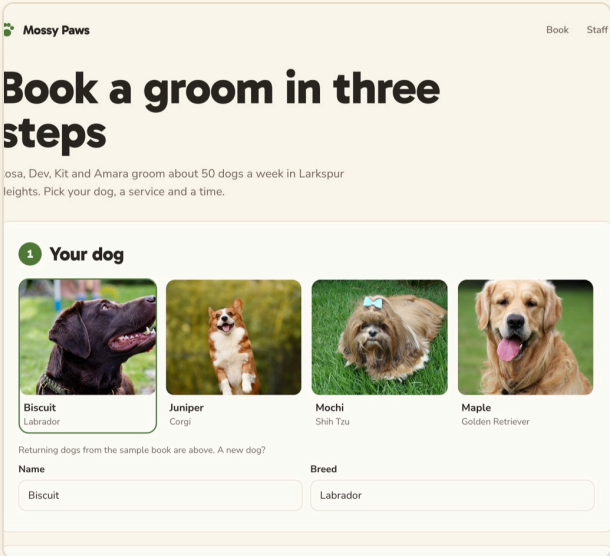

6,846 → 128 ms
until customer names show, same machine and data

1101 → 390 px
page width on a 390 px phone

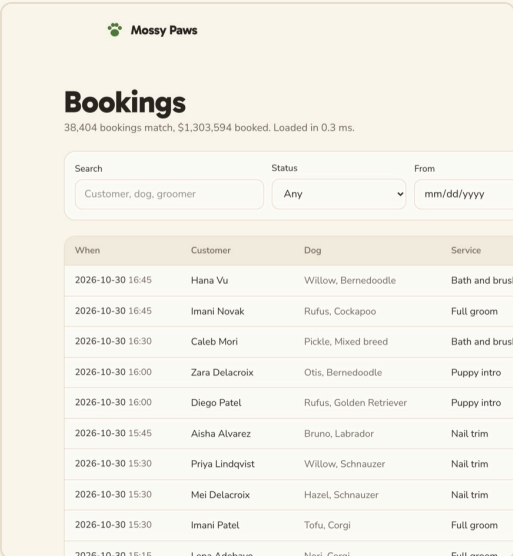

fails → passes
next build, with 300 N+1 requests per load down to 0

Before: build fails, 5.78 MB per load

After: three-step booking

After: plain, fast staff admin
